

Pablo Peillard

pablo@hashingsystems.com · github.com/publu · New York, NY

SUMMARY

Backend engineer with production experience building large-scale video processing pipelines, distributed GPU compute systems, and robotics data tooling. Co-founded a multichain DeFi protocol (QiDao) where I owned on-chain indexers, cross-chain data infra, and automated liquidation systems across a live financial system. Recent projects include a visual teleop and dataset collection dashboard for robotics (RoboRun) and a distributed pipeline classifying 180M+ social media videos using CLIP across GPU fleets.

EXPERIENCE

QiDao / Mai Finance — Co-Founder

2021 – 2024

Stablecoin protocol with hundreds of millions in AUM and billions in cumulative volume, deployed across 10+ blockchains.

- Co-founded the protocol from zero; raised VC funding and scaled from Polygon to 10+ chains including Ethereum, Arbitrum, Optimism, and BNB Chain
- Owned backend infrastructure: on-chain event indexers, cross-chain data aggregation services, liquidation automation bots, and API layers powering the protocol frontend
- Built vault health monitoring and collateral price feed systems that operated continuously across chains with no tolerance for downtime
- Operated production systems at scale: smart contract deployments, protocol parameter governance, treasury management, and incident response across a live financial system used by thousands of users

PROJECTS

RoboRun github.com/publu/roborun

Visual teleop, dataset collection, and one-click robot deployment dashboard. No CLI required — everything runs from the browser.

- Integrated YOLO, CLIP, and JEPA models for real-time inference over webcam and robot feeds
- Built CLIP-searchable spatial memory store: geo-indexed multi-robot frame storage with text query, spatial radius, and YOLO label search; optional S3 backend
- Integrated MuJoCo physics simulator in-browser with trained locomotion policies (Go1, G1) running ONNX neural network controllers
- Wired Cosmos 3 Nano world model for synthetic data generation and action prediction

MNFST — Social Video Intelligence Platform github.com/publu/mnfst

Built solo from scratch: a system that continuously ingests, classifies, and surfaces trends from 180M+ TikTok and YouTube Shorts videos across 68 countries.

- Sole engineer across the full stack: data collection, AI classification, storage, and the API layer that serves results
- Scaled AI processing to classify 180M+ videos using computer vision models running across GPU clusters
- Cut the cost of classifying each video by 20x through engineering optimizations in the inference pipeline
- Real-time trend data served globally with sub-second response times

GoldBot Sachs github.com/publu/goldbotsachs

ERC-4626 yield vault on Base wrapping Beefy Morpho USDC. Smart contract infra, referral mechanics, and yield dashboard.

cryptoskills github.com/publu/cryptoskills

Open-source CLI toolkit for DeFi: Aave, Morpho, Hyperliquid, Gearbox, and Pendle sentinels. ANSI truecolor terminal UI, standalone Python tools.

TECHNICAL SKILLS

Languages	Python, TypeScript, JavaScript, Solidity
Backend	FastAPI, Node.js, Railway, Cloudflare Workers, REST APIs
Distributed systems	Job queues, idempotent workers, GPU fleet orchestration
Video / data	Large-scale scraping, CLIP inference, distributed batch processing
Computer vision	CLIP, YOLO, JEPA, MuJoCo, ONNX locomotion policies
Storage	Cloudflare R2, PostgreSQL, KV caching, S3-compatible object storage
Compute	Cloud GPU fleet orchestration, Docker, distributed job coordination
AI / ML	CLIP, YOLO, JEPA, LLM inference (bf16, batching), multimodal pipelines
Frontend	React, Next.js, Vite, Tailwind CSS, Wagmi

EDUCATION

University of Texas at Dallas

B.S. Computer Science · 2020
